

Boot lands here. The left rail stops being a file tree and becomes the exam: **segment height = CEQ weight, colour = film-readiness** (the same pure check behind "Ready to film?"). One glance answers *how big, where's the weight, what's ready* — before a single click. ~14 resting controls where the tree had 69.

the map

is the content until a set opens (recent sets appear as three quiet chips, bottom)

VIDEOS

CAMPUS

MEMOS

WHAT CHANGED

Switcher = exams/maps only.

Videos · Campuses · Memos are three icons at the spine's foot.

Height carries meaning.

Readiness is ambient — the dot per segment and "72% ready" in the header.

Tree mode survives as a View ▾ toggle for when you want the literal list (bulk renames, drag-heavy sessions).

BUILD NOTE

One shared <ExamMap> component. This page is the authoring feed: readiness per set. The student page is the same component with a progress feed.

Click a segment and the spine **collapses to 46px but never leaves** — you're not "inside a folder", you're at a place on the map. The topic's sets fan out as cards carrying a mini-strip thumbnail (green rows = frames with clips), counts, and the readiness verdict with its reason.

[illegible]

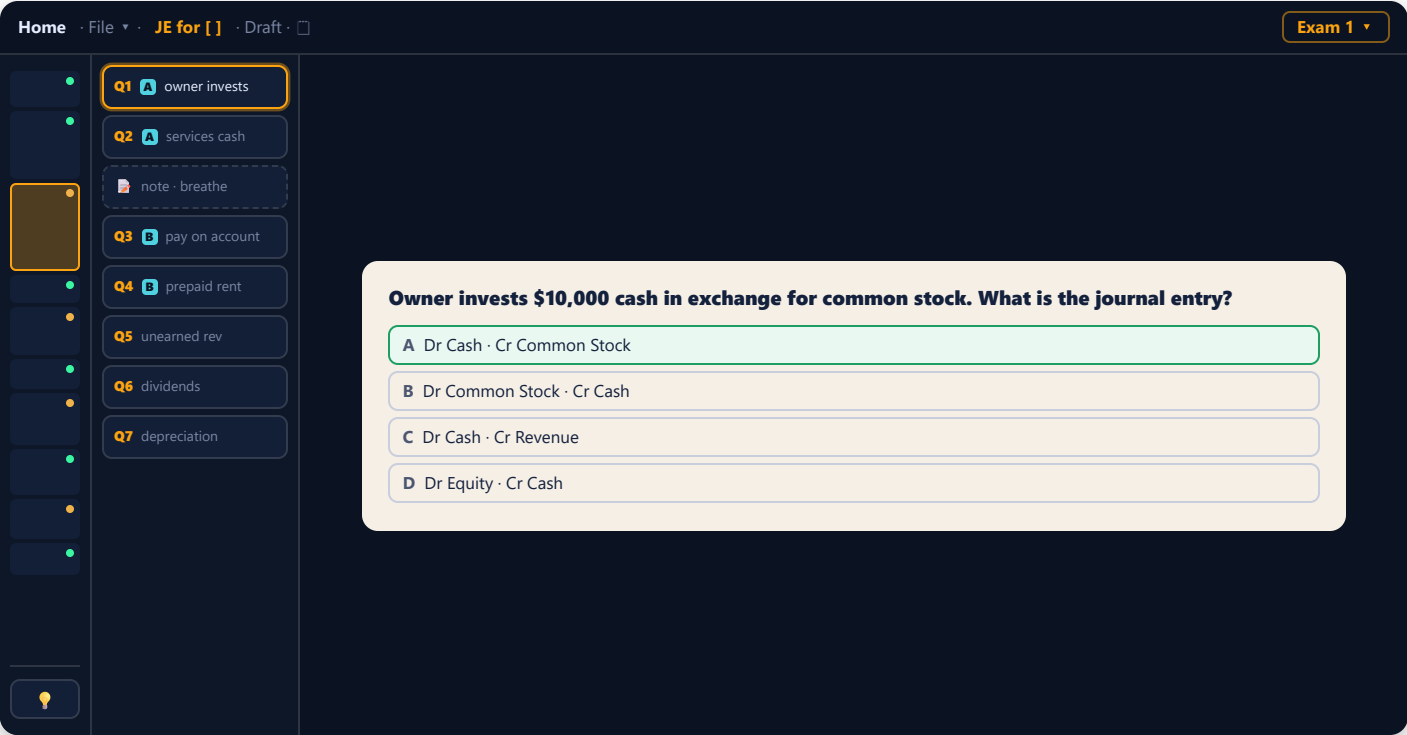

WHAT CHANGED

- ▶ **The spine is now the miniature.** Same proportions, same colours, 46px. Hovering a stub shows its topic name + readiness; clicking jumps.
- ▶ **Set cards replace set rows.** The mini-strip is a genuine thumbnail of the filmstrip: you see at a glance which frames already have clips.
- ▶ **The amber card explains itself** — “18 issues — no run letters”, not a bare dot. Krug: the answer, not the invitation to go find it.
- ▶ **Bulk ops, CSV round-trip, park/delete, rename** move to a  on each card and on the topic header. Nothing lost, nothing resting.
- ▶ **Partner shape:** hand a tutor one topic and this is their whole app — the same screen, smaller.

BUILD ORDER

State 1 → commit → State 2 → commit → State 3 → commit.
Tree mode stays wired throughout so filming is never blocked.

Exactly the Studio you filmed with this morning — filmstrip, editor, View ▾ — with the 46px spine still on the far left. **Three zoom levels visible at once** (exam · set · frame) and any topic is one click away. No “back”, no breadcrumb, no tree.

- WHAT CHANGED**
- ▶ **The spine persists** (your call). Cost: 46px. Gain: you always know where this set sits in the exam, and topic-hopping is one click mid-session.
 - ▶ **Everything else is what you already have** — filmstrip with run letters + note frames, auto-selected frame 1, View ▾, Ready to film?, Rehearse, □ Takes.
 - ▶ **Four zooms, one grammar:** exam spine → topic → set strip → frame. The run-rail idea you shipped, applied all the way up.
 - ▶ **Memo icon at the foot** replaces the resting memo panel — it opens the library when you actually want it (chain work opens it automatically).
- SAME COMPONENT, LATER**
- This spine becomes the **player outline** on the student side, then the full-screen course view. One component, two feeds — see the student PDF.
